How to measure a box:

How to dimension a box correctly? Always make sure that the opening is at the top and bottom for measuring (even if that is not how it will display). That way you know where \( A \times B \times C \) are in relation to the opening. Measure from left to right to get \( A \). Then measure from front to back to get \( B \). Then measure from the top to the bottom to get \( C \) dimension.
